

How the Agent Works

No predictions. Just edges.

An AI trading agent that hunts for **mispricings** in football prediction markets. It doesn't try to forecast who wins — it builds its own fair-value estimate, compares it against the sharpest markets in the world, and acts only when the two meaningfully disagree. Every position is logged publicly, before the event resolves.

Venue: Polymarket

Benchmark: Betfair · Pinnacle

Sport: Football

Mode: Public & transparent

Two waves, at the same time

The whole project sits at the intersection of two things happening right now.

①

AI can do real analysis

Research that used to take a desk of human analysts can now be done by a machine, continuously, without fatigue or bias.

②

Prediction markets are hot

Polymarket and similar venues are having their cultural moment — huge attention and volume, but comparatively thin systematic "sharp" money keeping prices honest.

The thesis: where a lot of attention meets relatively little disciplined pricing, mistakes appear. A patient, math-driven agent can find them. It never claims to know the future — it only points out when a market's price looks *wrong* relative to a better estimate.

Why “no predictions”?

A tipster says “Team A will win.” This agent says something narrower and more honest:

TIPSTER

“Team A wins.”

A guess about the world.

THIS AGENT

“This price looks mispriced.”

A claim about the *number*, not the outcome.

From raw data to a fair price

Three layers feed into every decision. The middle layer — the agent's own estimate of fair value — is the heart of the system.

Note: the specific models, parameters, filters and thresholds that turn data into a price are intentionally not shown here.

● THE SIGNAL

What counts as an “edge”

An edge is simply a gap: the agent thinks an outcome is more likely than the market's price implies. Below, a worked example with illustrative numbers.

If the agent believes the true chance is well above what the market charges, buying that outcome is a **positive-expectation bet** — even if this particular match still loses. Edges only pay off over many, many positions.

But a raw gap isn't enough

Most apparent edges are mirages — model error, stale prices, or markets that already know something we don't. Before acting, the agent puts every candidate through filters:

- Does the sharp-market consensus agree the price is off?
- Can the position actually be filled at a price that keeps the edge?
- Is the gap big enough to survive our own uncertainty?
- Are we already exposed to the same outcome elsewhere?

The exact gates and cut-offs are part of the secret sauce and are deliberately omitted.

● THE LOOP

What the agent does, all day

It runs on a continuous cycle — pre-match and live, while games are in play. No human picks the bets; the math decides.

Observe

Continuously watch live market prices and match situations — not just a once-a-day snapshot.

Price

Re-estimate the fair probability for each outcome as new information arrives.

Compare

Check our number against sharp books and against Polymarket's current price.

Act

If a filtered edge survives, take a small, fixed-size position — sometimes only on paper, sometimes live.

Measure

Record the result and grade the decision against the closing line (see next page).

How we know if it's working

Winning money on a few bets proves nothing — that can be luck. The agent is judged on a stricter, professional standard.

Closing Line Value (CLV)

The gold standard. Did we get a better price than the market's *final* price right before kickoff? Consistently beating the closing line is the real signature of edge — independent of whether any single bet won or lost.

Honest sample sizes

No conclusions from a handful of results. Performance is tracked over hundreds of positions, with yield and statistical significance — not cherry-picked highlights.

Luck vs. edge: positive returns with poor CLV is just luck and will fade. Modest returns with consistently positive CLV is a genuine, repeatable edge. We always report both.

Everything in the open

PUBLIC LOG

Every position is posted before the event resolves — including the losers and the bad calls.

LIVE DASHBOARD

A running P&L and history are visible to anyone at nopredictions.com.

THE GRAVEYARD

Failed ideas are documented too. The point is the experiment, not a highlight reel.

A live experiment, in public.

Can an AI agent, armed with years of market thinking, find edges humans miss on the prediction market everyone is watching? Follow along and find out.
